

AI Readiness Checklist

A condensed, practical checklist for how your site reads to search engines, answer engines and AI agents. Drawn from the 167-signal methodology behind 3webs — run the full audit free at 3webobs.com.

SEO — the human web

- ☐ One H1 per page, clear heading hierarchy (H1 -> H2 -> H3)
- ☐ Title tag 15-65 characters, unique per page
- ☐ Meta description 50-165 characters, unique per page
- ☐ HTTPS on every page, HTTP redirects to HTTPS
- ☐ XML sitemap present and submitted to Search Console
- ☐ Canonical tags on every page, no conflicting canonicals
- ☐ Every image has descriptive alt text

AEO — answer engine optimization

- ☐ FAQ content is visible in the page HTML, not just in JSON-LD schema
- ☐ FAQPage structured data matches the visible FAQ content exactly
- ☐ Direct, extractable answers near the top of key pages (answer-first structure)
- ☐ Breadcrumb structured data on pages with a real navigational hierarchy

GEO — generative engine / entity optimization

- ☐ llms.txt published at the root, in real markdown format (not a duplicate sitemap)
- ☐ Organization structured data complete: legal name, address, identifiers, sameAs links
- ☐ Brand name used consistently across the site, LinkedIn, and other public profiles
- ☐ robots.txt explicitly allows major AI crawlers (GPTBot, ClaudeBot, Google-Extended, PerplexityBot)
- ☐ Open Graph and Twitter Card metadata complete on every page

AIO — AI optimization

- ☐ Content answers real user questions in natural language, not just keyword phrases
- ☐ Each page covers one clear topic in enough depth to stand alone
- ☐ Dates of publication and last modification are visible and in structured data
- ☐ Internal links connect related pages by topic, not just by navigation menu

AI Signals — machine trust files

- ☐ ai.json or an equivalent machine-readable identity file is published
- ☐ A SHA-256 integrity manifest exists for key public files
- ☐ An AI usage / training-permission policy is explicitly declared
- ☐ EU AI Act transparency statement published if AI is used in the product

A2A — agent-to-agent readiness

- ☐ An agent card is published at /.well-known/agent-card.json
- ☐ Every declared capability lists a real input, output, and endpoint
- ☐ At least one capability is marked safe to invoke, so agents can verify it actually works
- ☐ 404s return a real 404 status, not the homepage with a 200

This checklist is a starting point, not a substitute for the full audit — the live engine checks 167 signals with real evidence and gives you a prioritised action plan. Run it free at 3webobs.com. Published by AVENTURE S.R.L. under the 3webs brand.
